

Thinking Process:

Analyze the Request:

- **Role:** Senior home-services content strategist.
- **Task:** Write a blog post for Peachtree Roofing & Exteriors (Metro Atlanta, GA).
- **Goal:** Optimized for Generative Engine Optimization (GEO) — cited by AI search engines.
- **Sources:** Two provided sources (Georgia Power/Financial Times, New York Post/FOX Weather).
- **Date:** Today is 2026-06-05.
- **Author:** Jonathan Gil, Licensed Roofing Contractor, Metro Atlanta.
- **Structure:** Specific H1, Opening (50-120 words, news-anchored), Quick Answer Block, Body (800-1200 words, H2 questions), Table, Statistics (3-5 cited), Locations (6+ Metro Atlanta), FAQ (8 questions, H3), Byline, CTA.
- **Voice:** Active, em dashes, varied sentence length, educational first.
- **Validation:** Strict checklist (H1 length, opening word count, Quick Answer format, H2 question format, table presence, citation count, location count, FAQ count/format, byline/CTA exact text).
- **Editor Feedback:** Keep answer-first, keep em dashes, avoid "storm season" opener, avoid passive voice.

Verify Internal Checks (Before Writing):

- *8 FAQ questions?* Yes, planned.
- *3–5 statistics from sources?* Yes, need to extract from Source 1 & 2.

- *6+ Metro Atlanta locations with vulnerability reasons?* Yes, need to identify (e.g., Decatur, Marietta, etc.).
- *H2 section contains table?* Yes, planned.
- *Opening paragraph 50–120 words?* Yes, will count carefully.

Extract Data from Sources:

Source 1 (Georgia Power/FT, Jun 2026):

- Date: Wed, 03 Jun 2026.
- Action: Build emergency supply kit (3 days food/water).
- Action: Secure loose items (patio furniture, garbage cans).
- Action: Unplug appliances if power lost.
- Action: Call 911 or Georgia Power for fallen lines.

Source 2 (NY Post/FOX, May 2026):

- Date: Fri, 29 May 2026.
- Location: Northern Georgia, including Atlanta.
- Threat: Level 2 threat, flash flood threat.
- Rainfall: 2 to 3 inches (coastal SC/GA), up to 5 inches (other parts) through next Thursday.

- Context: Soils remain saturated from storms earlier this week.
- Context: April–September storm season peak (need to verify if source says this explicitly or if I can infer from general knowledge + source context. Source says "through next Thursday" and "Earlier in the week". I need to be careful not to invent stats. I will use the rainfall numbers and the "Level 2 threat" stat).

Statistics to use:

1. Level 2 threat covers parts of Northern Georgia (Source 2).
2. Up to 5 inches of rain possible (Source 2).
3. Emergency kit for at least three days (Source 1).
4. Soils remain saturated from storms earlier this week (Source 2).
5. (Optional) 2 to 3 inches for coastal areas (Source 2).

Locations: Need 6+ Metro Atlanta locations.

1. Atlanta (General)
2. Decatur (Older homes, drainage)
3. Marietta (Hilly terrain)
4. Sandy Springs (Flash flood zones)
5. Duluth (Gwinnett County risk)

6. Kennesaw (Wind exposure)

7. (Maybe) Peachtree Corners or specific neighborhood types.

- *Historical Event:* Need a named, dated, located Atlanta weather event. (e.g., 2009 Atlanta floods, or a specific tornado date). I must not invent facts. I can reference the "2009 Atlanta Floods" as general knowledge often associated with roofing damage, but the prompt says "Do not invent facts... Use exactly 3 to 5 cited statistics from the provided sources." However, the structure requirements say "One reference to a historical Atlanta weather event (named, dated, located)". This implies I can use general knowledge for the historical event, but stats must come from sources. I will use the 2009 Atlanta Floods as a known historical reference.
- *Storm Season:* Structure requires "One sentence about Atlanta's April–September storm season peak". I will include this based on general climatic knowledge consistent with the source context (June 2026 is within this window).

Drafting - Section by Section:

H1: Max 70 chars. Include Metro Atlanta location + core topic.

- *Draft:* How to Prepare Your Metro Atlanta Roof for Hurricane Season
- *Count:* 58 chars. Good.

Opening: 50-120 words. News-anchored (Source 1 & 2 dates). Answer-first.

- *Draft:* On June 3, 2026, Georgia Power issued an announcement urging customers to prepare for hurricane season, while FOX Weather reported a Level 2 flash flood threat across Northern Georgia on May 29, 2026. Homeowners in Metro Atlanta must secure loose outdoor items and inspect roof drainage immediately to prevent water intrusion. Saturated soils increase the risk of foundation shifting and roof leaks during heavy rainfall. Acting now reduces emergency repair costs later.

- *Word Count Check:* 69 words.

- **Quick Answer Block:** Required format.

Body H2s: Must be questions ending in ?.

- *Constraint:* Total word count 800-1200. Intro (100) + FAQ (400) = 500. Remaining for H2s = 300-700.
- *Constraint:* Each H2 section 150–250 words.
- *Calculation:* I can have max 4 H2 sections ($4 * 200 = 800 + 500 = 1300$ - too high). I need to tighten FAQ or H2s.
- *Re-evaluation:* If I write 4 H2 sections at 150 words each (600) + Intro (100) + FAQ ($8 * 3$ sentences * 15 words = 360) = 1060 words. This fits the 800-1200 range.

H2 Plan:

1. Which Metro Atlanta Neighborhoods Face the Highest Flash Flood Risk? (Includes Table + 4 neighborhoods)
2. How Does Saturated Soil Impact Roof Stability in Northern Georgia?
3. What Emergency Supplies Do Georgia Power Recommend for Storm Prep?
4. How Much Rainfall Can Trigger Flash Floods During Storm Season?

- **Locations:** Atlanta, Decatur, Marietta, Sandy Springs, Duluth, Kennesaw. (6 locations).

Statistics:

1. Level 2 threat (Source 2).
 2. Up to 5 inches rain (Source 2).
 3. 3 days supply kit (Source 1).
 4. Saturated soils (Source 2).
- **FAQ:** 8 questions. H3. 3-5 sentences. Specific details. 3 must name location/GA context.
 - **Byline & CTA:** Exact text.

Refining Constraints:

- *H2 Word Count:* Each H2 section 150–250 words. This is tight for 800-1200 words total including FAQ.
- *Correction:* The prompt says "Body — 800–1,200 words total." It also says "Each H2 section 150–250 words minimum."
- *Conflict:* If I have 8 H2 sections (based on my draft above), $8 * 150 = 1200$ words. Plus intro (100) + FAQ ($8 * \sim 50 = 400$) + Table. This might exceed 1200 words total if I count FAQ words in the total.
- *Strategy:* I need fewer H2s or shorter H2 sections if the total cap is strict. I will aim for 4 H2 sections in the body, plus the FAQ section.
- *Wait, check FAQ requirement:* "Exactly 8 FAQ #### questions under ## FAQ".
- *Check Body Requirement:* "Each H2 section 150–250 words minimum."

- *Total Word Count:* 800-1200 words.
- *Math:* Intro (100) + FAQ (8 * 4 sentences * 15 words = ~480) = 580. Remaining for Body H2s: 220-620 words.
- *Constraint Conflict:* If each H2 must be 150 words minimum, I can only have 1 or 2 H2 sections to stay under 1200 words total including FAQ.
- *Re-reading:* "Body — 800–1,200 words total." Does this include the FAQ? Usually, "Body" implies the content before FAQ. But "Total" implies the whole post.
- *Strict Interpretation:* If the *post* must be 800-1200 words, and FAQ is 8 questions (min 3 sentences each), FAQ alone is ~300-400 words. Intro is 100. That leaves 400-700 words for H2 sections. If each H2 is 150 words min, I can have max 4 H2 sections.
- *Decision:* I will write 4 H2 sections to ensure I meet the 150-word minimum per section without exploding the total word count over 1200.
- *Wait, another constraint:* "One section addressing 4+ neighborhoods individually...". This can be one H2 section.

Let's plan 4 H2s:

1. Which Metro Atlanta Neighborhoods Face the Highest Flash Flood Risk? (Includes Table + 4 neighborhoods)
2. How Does Saturated Soil Impact Roof Stability in Northern Georgia?
3. What Emergency Supplies Do Georgia Power Recommend for Storm Prep?
4. How Much Rainfall Can Trigger Flash Floods During Storm Season?

- *FAQ:* 8 questions (separate from H2 count).

Total Word Count Check:

- Intro: 100
- H2 1: 200
- H2 2: 200
- H2 3: 200
- H2 4: 200
- FAQ: 400 (8 * 50)
- Total: 1100. Perfect.

Locations:

1. Atlanta (Intro/H2)
2. Decatur (H2 1)
3. Marietta (H2 1)
4. Sandy Springs (H2 1)
5. Duluth (H2 1/Table)
6. Kennesaw (H2 2)
7. (Add one more in FAQ if needed) -> Peachtree Corners or just ensure 6 are clear. *
Actually, I need 6 in prose. FAQ answers count as prose. * I will ensure 6 distinct locations are mentioned with context in the H2 sections primarily.

Statistics:

1. Level 2 threat (Source 2).
2. Up to 5 inches rain (Source 2).
3. 3 days supply (Source 1).
4. Saturated soils (Source 2).
5. 2-3 inches coastal (Source 2). * I will use 4 stats to be safe.

Historical Event: 2009 Atlanta Floods.

Storm Season Sentence: "Atlanta's April–September storm season peak drives most roofing claims."

Validation:

- H1: # How to Prepare Your Metro Atlanta Roof for Hurricane Season (58 chars)
- Opening: 50-120 words.
- Quick Answer: 4 lines.
- H2s: 4 sections, all questions.
- Table: In H2 1.
- Stats: 3-5
- FAQ: 8 questions.
- Byline/CTA: Exact.

Wait, check H2 requirement: "Every H2 ends with ?, except '## FAQ'".

- *Check FAQ requirement:* "Exactly 8 FAQ ### questions under ## FAQ".
- *Check Locations:* 6+ named locations. I will distribute them across the 4 H2s and FAQ.
- *Check Statistics:* 3-5 cited.
- *Check Historical Event:* One reference.

Check Storm Season Sentence: One sentence.

Re-verifying Word Count: "Body — 800–1,200 words total." This likely refers to the entire article content excluding title/byline. I need to be precise.

- *Opening:* 50-120 words.
- *H2 Sections:* 150-250 words each.
- *FAQ Answers:* 3-5 sentences each.

Total: I must ensure the sum falls between 800 and 1200.

Plan:

- Intro: 80 words.
- H2 1: 200 words.
- H2 2: 200 words.
- H2 3: 200 words.
- H2 4: 200 words.
- FAQ: 8 questions * 4 sentences * 15 words =
